

A background image showing the lower legs and feet of people walking on a sidewalk. They are carrying white H&M shopping bags with the red H&M logo. The scene is brightly lit, suggesting daytime.

H&M Shopping Recommendation System

Jeffrey, Lu, Ingrid

Objectives ✕

How will our recommendation systems benefit to H&M?

Reduce churn

Increase user satisfaction

**Increase sales,
AOV & AOQ**

(Average Order Value & Average Order Quantity)

**Reduce return for
sustainability**

Collaborative Filtering

Alternating least square(ALS)

Dataset Characteristic:

- ❖ Implicit dataset (without explicit ranking)

Application:

1. Data Preprocessing
 - ❖ Take the latest 3 month data for model application (3,647,973x5)
 - ❖ Create additional column 'Frequency' - No. of times the same user purchased a specific item
 - ❖ Reassign customer_id from 0 to 530342 since matrix only takes numeric data
2. Model Building
 - ❖ Columns: Customer_id, Article_id, Frequency
 - ❖ Use of Implicit Library
 - csr_matrix (Compressed Sparse Row matrix)
 - Use of ALS to build model

LSTM Model

Find out the top 10 products for each day in 2 year and make a product_list

Filter out the the transaction data according to the product_list

Make dummies according to product_list
If product was top 10 of that day:1
otherwise: 0

Compile every 60 days data which are 3 dimensional arrays into the list

Build and Train the LSTM Model with
Epochs =10 Dropout=0.2

Input the last 60 days data in the model
and predict the top 10 products in the
future
